Update Settings

Configuration

Here you can update different properties of the kapp including display options, workflow options, and categories.

The system was designed to be hierarchical so that properties configured here at the kapp level will override properties set at the space level.

If any properties are not configured here, the properties set at the space level will be used.

Furthermore, if the properties are set at the form level, those will override the properties set here.

Advanced Management

Visit the Kinetic Request Management Console for advanced configuration options.

Bridge Qualifications   +

No Qualifications to display
Qualifications used to retrieve the data from this datastore.

Datastore Configuration

To update the datastore form fields, click the Builder button, which will open the form builder in a new window. You will need to reload this page after making changes in the form builder, which can be done by clicking the reload button.

Datastore forms cannot contain more than 1 page.

To view, add, or edit the data stored in this datastore, click the Records button.

Display Table Options

The Display Table Options section lists all of the fields that exist in this datastore. The order in this table will determine the order the records appear in the Records table. You may order the table by dragging the rows.

Visible: Should this field appear in the records table?

Searchable: Should the data in this field be searchable in the records table?

Sortable: Should the records table be sortable by this field?

Bridge Name

The Kinetic Core bridge, which allows for automatic bridge creation for this datastore.

Bridge Qualifications

List of existing qualifications used to retrieve the data from this datastore.
